## What is The Boot™?

The Boot™ is a security device designed to impede doorway entry. It is a rectangular-shaped plate of 1/8 inch thick cold-rolled steel that when fully engaged can withstand 16,000 pounds of pressure. The Boot™ weighs 5.1 pounds and while it is small, it is mighty when stopping entry from the danger that resides on the other side of your door.

The creator of The Lock Down Company and The Boot™, Rob Couturier, developed the security device after a member of his family was physically attacked. The Boot's name and design concept can be attributed to the attacker, who to protect himself from approaching law enforcement, locked himself in his apartment: Sitting on the floor with his back against the entryway wall and pushing his boots up against the back of the door, he made it difficult for anyone to enter. The leverage of the boots was incredibly strong and the image was hard to forget.

The Boot™ uses the same system of leveraging power to enhance lockdown strength and safety of the door to keep danger out. It can be activated in seconds and can help save lives. One quick decision when it counts!

# KEEP DANGER OUT

**Simply Drop it to Lock it!**

Interior Door Locking Security Device

The Boot™ keeps danger out and allows emergency help in to assist and protect you.

In a shooter scenario, The Boot™ is an interior door safety/security device that is designed to be deployed in an instant preventing entry into any room or office.

Made from .125" cold-rolled industrial steel, with steel pins and a floor mounted steel sleeve, The Boot™, when engaged can withstand 16,000 pounds of pressure preventing the door from opening. To unlock and gain entry, a strictly proprietary and confidential Spin Key must be used. The Boot™ is disengaged from the floor mounted sleeve allowing the door to be quickly and efficiently opened from the outside by safety officers or personnel.

The Boot™ is ideal for school, hospital, home and office use during lockdowns. It is quick and easy to deploy and can be done without leaving the room or office. The Boot™ is a unique safety system, the first to furnish a patent-pending release mechanism. Should authorized emergency personnel (principals, teachers, hospital personnel, custodial or security staff, police or firemen) need to enter a space locked secure by The Boot™, all that is needed is the specially-designed release mechanism and a few seconds of time.

When it Counts
